1.

$$\int_{-\infty}^{t} x(s)ds = \int_{-\infty}^{t} \sum_{k=-\infty}^{\infty} a_k e^{jk2\pi s} ds$$

$$= \sum_{k=-\infty}^{\infty} \left(a_k \cdot \frac{e^{jkw_0 t}}{jkw_0} \Big|_{-\infty}^{t} \right)$$

$$= \sum_{k=-\infty}^{\infty} \left(a_k \cdot \frac{e^{jkw_0 t}}{jkw_0} - a_k \cdot \frac{e^{jkw_0(-\infty)}}{jkw_0} \right)$$

$$= \sum_{k=-\infty}^{\infty} \left(a_k \cdot \frac{e^{jkw_0 t}}{jkw_0} - a_k \cdot \frac{0}{jkw_0} \right)$$

$$= \sum_{k=-\infty}^{\infty} \left(a_k \cdot \frac{e^{jkw_0 t}}{jkw_0} \right)$$

This equation is in the synthesis equation form where $a_k \frac{1}{jkw_0}$ is the Fourier series coefficients of the integrated signal.

Since w_0 is the frequency of the signal, $w_0 = \frac{2\pi}{T}$ where T is the period of the signal.

Substituting w_0 in the equation above, we prove the integration property of the Fourier series.

- 2. (a) $x(t)x(t) \leftrightarrow a_k * a_k$ (Multiplication Property)
 - (b) $\mathcal{E}v\{x(t)\} \leftrightarrow b_k$ (Even Property)

$$b_k = \begin{cases} a_k & k \ge 0 \\ a_{-k} & k < 0 \end{cases}$$

(c) $x(t+t_0) + x(t-t_0) \leftrightarrow a_k e^{jkw_0t_0} + a_{-k}e^{-jkw_0t_0}$ (Shifting and Linearity Properties)

3.

$$x(t) = \begin{cases} 2 & x \in (0,1) \\ 0 & x \in (1,2) \\ -2 & x \in (2,3) \\ 0 & x \in (3,4) \\ \text{Periodic} & x \notin (0,4) \end{cases}$$

$$\begin{split} a_k &= \frac{1}{T} \int_0^T x(t) e^{-jkw_0 t} dt \\ &= \frac{1}{4} \Big(\int_0^1 2 e^{-jkw_0 t} dt + \int_1^2 0 dt + \int_2^3 -2 e^{-jkw_0 t} dt + \int_3^4 0 dt \Big) \\ &= \frac{1}{4} \Big(2 \frac{e^{-jkw_0 t}}{-jkw_0} \Big|_0^1 - 2 \frac{e^{-jkw_0 t}}{-jkw_0} \Big|_2^3 \Big) \\ &= \frac{1}{4} \Big(2 \frac{e^{-jkw_0}}{-jkw_0} - \frac{2}{-jkw_0} - 2 \frac{e^{-3jkw_0}}{-jkw_0} + 2 \frac{e^{-2jkw_0}}{-jkw_0} \Big) \\ &= \frac{1}{-2jkw_0} \Big(e^{-jkw_0} - 1 - e^{-3jkw_0} + e^{-2jkw_0} \Big) \end{split}$$

Substitute $w_0 = \frac{2\pi}{T} = \frac{2\pi}{4} = \frac{\pi}{2}$

$$\begin{split} a_k &= \frac{1}{-2jk\frac{\pi}{2}} (e^{-jk\frac{\pi}{2}} - 1 - e^{-3jk\frac{\pi}{2}} + e^{-2jk\frac{\pi}{2}}) \\ &= \frac{1}{-jk\pi} (e^{-jk\frac{\pi}{2}} - 1 - e^{-3jk\frac{\pi}{2}} + e^{-jk\pi}) \\ &= \frac{1}{-jk\pi} (\cos(-k\frac{\pi}{2}) + j\sin(-k\frac{\pi}{2}) - 1 - \cos(-3k\frac{\pi}{2}) - j\sin(-3k\frac{\pi}{2}) + \cos(-k\pi) + j\sin(-k\pi)) \\ &= \frac{1}{-jk\pi} (-2j\sin(k\frac{\pi}{2}) - 1 + \cos(-k\pi)) \end{split}$$

7. (a)

$$y(t) = H(jk\omega_0)e^{jk\omega_0t} \qquad \text{Lecture Notes 6.8}$$

$$x(t) = \sum_{k=-\infty}^{+\infty} a_k e^{jk\omega_0t} \Rightarrow y(t) = \sum_{k=-\infty}^{+\infty} H(jk\omega_0)a_k e^{jk\omega_0t} \qquad \text{Linearity Property}$$

$$\omega_0 = \frac{2\pi}{T} = \frac{2\pi}{\pi/K} = 2K$$

$$y(t) = \sum_{k=-\infty}^{+\infty} H(j2Kk)a_k e^{jk2Kt} \qquad \text{Substitute } \omega_0$$

$$y(t) = \sum_{k=-40/K}^{+40/K} a_k e^{jk2Kt} \qquad |\omega| \le 80 \Rightarrow H(j\omega) = 1$$

$$\sum_{k=-40/K}^{+40/K} a_k e^{jk2Kt} = \sum_{k=-\infty}^{+\infty} a_k e^{jk2Kt} \qquad x(t) = y(t)$$

In conclusion, $a_k = 0$ for $k \notin [-40/K, 40/K]$.

(b) Nothing can be concluded if $x(t) \neq y(t)$.

```

```

from q8b import SignalFromSpectralCoefficients, t

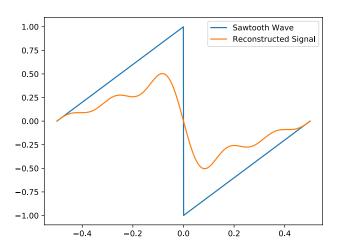

Figure 8: Approximated Sawtooth Wave with 10 Spectral Coefficients

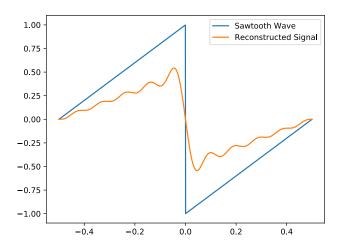

Figure 9: Approximated Sawtooth Wave with 50 Spectral Coefficients

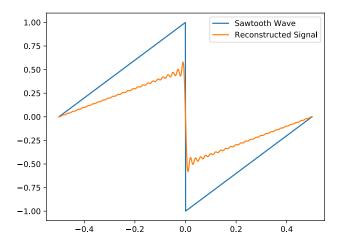

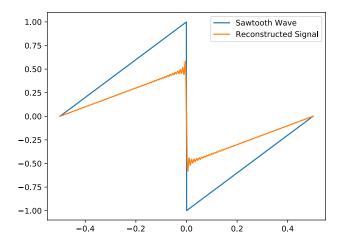

Figure 10: Approximated Sawtooth Wave with 100 Spectral Coefficients

Although, increasing the number of spectral coefficients increases the accuracy of the approximation, there is a scaling difference between the original and the approximated wave. This is because the number of coefficients used is far less than the number of points in the original wave. For an accurate approximation, the number of coefficients should be equal to the number of points in a period of the original wave.
